

Market Risk Premium

Market risk premium is also called the equity risk premium, and market premium. The market risk premium is the extra return an investor earns over the risk-free rate for owning risky equity instead of risk-free government bonds.

Market risk premium is usually used within the context of the Capital Asset Pricing Model (CAPM). And it is usually defined as follows:

$$\text{Equity Risk Premium} = RP_m = (K_m - K_{RF})$$

K_m = Required return on the market portfolio

K_{RF} = Risk-free rate

K_m is also the return necessary to compensate an investor for assuming an "average" amount of risk.
